**Abstract:** A new class of functions called faintly  $g$ -continuous functions has been defined and studied in topological space. Also, the relationships between faintly  $g$ -continuous functions and graphs are investigated.

**AMS Subject Classification:** 54D10

**Key Words:** topological spaces,  $g$ -open sets,  $g$ -continuity, faintly  $g$ -continuity

### 1. Introduction

Generalized open sets play a very important role in General Topology and they are now the research topics of many topologists worldwide. Indeed a significant theme in General Topology and Real analysis concerns the variously modified forms of continuity, separation axioms etc. by utilizing generalized closed sets. In 1970, Levine [6] initiated the study of so-called  $g$ -closed sets, that is, a subset  $A$  of a topological space  $(X, \tau)$  is  $g$ -closed if the closure of  $A$  included in every open superset of  $A$  and defined a  $T_{1/2}$  space to be one in which the closed sets and the  $g$ -closed sets coincide. In this paper, a new class of functions called

faintly  $g$ -continuous functions has been defined and studied in topological space. Relationships among this new class of functions and  $GO$ -connected spaces and  $GO$ -compact spaces are investigated. Also, the relationship between faintly  $g$ -continuous functions and graphs are investigated.

## 2. Preliminaries

In the present paper,  $(X, \tau)$  and  $(Y, \sigma)$  represent topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $\text{Cl}(A)$ ,  $\text{Int}(A)$  and  $A^c$  denote the closure of  $A$ , the interior of  $A$  and the complement of  $A$  in  $X$ , respectively. The complement of  $g$ -closed set is called  $g$ -open. The family of all  $g$ -open sets of  $(X, \tau)$  is denoted by  $GO(X)$ . A point  $x \in X$  is called a  $\theta$ -cluster point of  $A$  if  $\text{Cl}(A) \cap A \neq \emptyset$  for every open set  $V$  of  $X$  containing  $x$ . The set of all  $\theta$ -cluster points of  $A$  is called the  $\theta$ -closure of  $A$  and is denoted by  $\text{Cl}_\theta(A)$ . If  $A = \text{Cl}_\theta(A)$ , then  $A$  is said to be  $\theta$ -closed. The complement of  $\theta$ -closed set is said to be  $\theta$ -open. The union of all  $\theta$ -open sets contained in a subset  $A$  is called the  $\theta$ -interior of  $A$  and is denoted by  $\text{Int}_\theta(A)$ . It follows from [12] that the collection of  $\theta$ -open sets in a topological space  $(X, \tau)$  forms a topology  $\tau_\theta$  on  $X$ .

**Definition 1.** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be:

- (i) faintly continuous [7] if  $f^{-1}(V)$  is open in  $X$  for every  $\theta$ -open set  $V$  of  $Y$ .
- (ii)  $g$ -continuous [1] if  $f^{-1}(V)$  is  $g$ -closed set in  $X$  for each closed set  $V$  of  $Y$ .
- (iii)  $gc$ -irresolute [1] if  $f^{-1}(V)$  is  $g$ -closed set in  $X$  for each  $g$ -closed set  $V$  of  $Y$ .
- (iv)  $gc$ -homeomorphism [8] if it is bijective,  $gc$ -irresolute and its inverse  $f^{-1}$  is  $gc$ -irresolute.
- (v)  $g$ -closed [9] if  $f(F)$  is  $g$ -closed in  $Y$  for every closed set  $F$  of  $X$ .

## 3. Faintly $g$ -Continuous Functions

**Definition 2.** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be faintly  $g$ -continuous if  $f^{-1}(V)$  is  $g$ -open in  $X$  for every  $\theta$ -open set  $V$  of  $Y$ .

**Theorem 3.** For a function  $f : (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- (i)  $f$  is faintly  $g$ -continuous;
- (ii)  $f^{-1}(F)$  is  $g$ -closed in  $X$  for every  $\theta$ -closed subset  $F$  of  $Y$ ;
- (iii)  $f : (X, \tau) \rightarrow (Y, \sigma_\theta)$  is  $g$ -continuous.

*Proof.* Easy proof and hence omitted. □

**Theorem 4.** Every  $g$ -continuous function is faintly  $g$ -continuous.

*Proof.* Clear. □

**Remark 5.** The converse of Theorem 4 is not true in general as can be seen from the following example.

**Example 6.** Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, X\}$  and  $\sigma = \{\emptyset, \{b\}, \{c\}, \{b, c\}, X\}$ . Then the identity function  $f : (X, \tau) \rightarrow (X, \sigma)$  is faintly  $g$ -continuous but not  $g$ -continuous.

**Definition 7.** A topological space  $(X, \tau)$  is said to be a  $T_{1/2}$ -space [6] if every  $g$ -closed subset of  $(X, \tau)$  is in closed.

**Theorem 8.** Let  $(Y, \sigma)$  be a  $T_{1/2}$ -space. Then a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous if and only if it is faintly continuous.

*Proof.* Follows from the Definition 7. □

**Theorem 9.** If a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous and  $(Y, \sigma)$  is a regular space, then  $f$  is  $g$ -continuous.

*Proof.* Let  $V$  be any open set of  $Y$ . Since  $Y$  is regular,  $V$  is  $\theta$ -open in  $Y$ . Since  $f$  is faintly  $g$ -continuous, by Theorem 3, we have  $f^{-1}(V)$  is  $g$ -open and hence  $f$  is  $g$ -continuous. □

**Theorem 10.** If a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous, then for each point  $x \in X$  and each  $\theta$ -open set  $V$  containing  $f(x)$ , there exists a  $g$ -open set  $U$  containing  $x$  and  $f(U) \subseteq V$ .

*Proof.* Clear. □

**Remark 11.** The following example shows that the composition of two faintly  $g$ -continuous functions need not be faintly  $g$ -continuous.

**Example 12.** Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, X\}$ ,  $\sigma = \{\emptyset, \{a\}, \{b, c\}, X\}$  and  $\eta = \{\emptyset, \{b\}, \{a, c\}, X\}$ . Define a function  $f : (X, \tau) \rightarrow (X, \sigma)$  by  $f(a) = b$ ,  $f(b) = a$  and  $f(c) = c$  and  $g : (X, \sigma) \rightarrow (X, \eta)$  an identity function. Then  $f$  and  $g$  are faintly  $g$ -continuous functions but their composition is not faintly  $g$ -continuous.

Now we investigate some basic properties of faintly  $g$ -continuous functions concerning composition and restriction. The proof of the first two results are straightforward and are omitted.

**Theorem 13.** *If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is  $gc$ -irresolute and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  is faintly  $g$ -continuous, then  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is faintly  $g$ -continuous.*

It is well known that a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be quasi- $\theta$ -continuous [10] if  $f^{-1}(V)$  is  $\theta$ -open in  $(X, \tau)$  for every  $\theta$ -open set  $V$  of  $(Y, \sigma)$ .

**Theorem 14.** *If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous and  $g : (Y, \sigma) \rightarrow (Z, \gamma)$  is quasi- $\theta$ -continuous, then  $g \circ f : (X, \tau) \rightarrow (Z, \gamma)$  is faintly  $g$ -continuous.*

Let  $\{X_\alpha : \alpha \in \Lambda\}$  and  $\{Y_\alpha : \alpha \in \Lambda\}$  be two families of topological spaces with the same index set  $\Lambda$ . The product space of  $\{X_\alpha : \alpha \in \Lambda\}$  is denoted by  $\prod \{X_\alpha : \alpha \in \Lambda\}$  (or simply  $\prod X_\alpha$ ). Let  $f_\alpha : X_\alpha \rightarrow Y_\alpha$  be a function for each  $\alpha \in \Lambda$ . The product function  $f : \prod X_\alpha \rightarrow \prod Y_\alpha$  is defined by  $f(\{x_\alpha\}) = \{f_\alpha(x_\alpha)\}$  for each  $\{x_\alpha\} \in \prod X_\alpha$ .

**Theorem 15.** *If a function  $f : X \rightarrow \prod Y_\alpha$  is faintly  $g$ -continuous, then  $P_\alpha \circ f : X \rightarrow Y_\alpha$  is faintly  $g$ -continuous for each  $\alpha \in \Lambda$ , where  $P_\alpha$  is the projection of  $\prod Y_\alpha$  onto  $Y_\alpha$ .*

*Proof.* Let  $V_\alpha$  be any  $\theta$ -open set of  $Y_\alpha$ . Then,  $P_\alpha^{-1}(V_\alpha)$  is  $\theta$ -open in  $\prod Y_\alpha$  and hence  $(P_\alpha \circ f)^{-1}(V_\alpha) = f^{-1}(P_\alpha^{-1}(V_\alpha))$  is  $g$ -open in  $X$ . Therefore,  $P_\alpha \circ f$  is faintly  $g$ -continuous.  $\square$

**Theorem 16.** *Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \gamma)$  be functions. If  $f$  is bijective, continuous and  $g$ -closed, and if  $g \circ f : (X, \tau) \rightarrow (Z, \gamma)$  is faintly  $g$ -continuous, then  $g : (Y, \sigma) \rightarrow (Z, \gamma)$  is faintly  $g$ -continuous.*

*Proof.* Let  $V$  be a  $\theta$ -open set of  $Z$ . Then  $(g \circ f)^{-1}(V) = f^{-1}(g^{-1}(V))$  is  $g$ -open in  $X$ . Since  $f$  is bijective, continuous and  $g$ -closed,  $f$  maps  $g$ -open sets to  $g$ -open sets [[3], Theorem 3] hence it follows that  $g^{-1}(V) = f(f^{-1}(g^{-1}(V)))$  is  $g$ -open in  $Y$ .  $\square$

**Corollary 17.** *Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a bijective  $g$ -homeomorphism and let  $g : (Y, \sigma) \rightarrow (Z, \gamma)$  be a function. Then  $g \circ f : (X, \tau) \rightarrow (Z, \gamma)$  is faintly  $g$ -continuous if and only if  $g$  is faintly  $g$ -continuous.*

**Theorem 18.** *If  $f : (X, \tau, \mathcal{I}) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous and  $A$  is a closed subset of  $X$ , then  $f|_A : (A, \tau|_A) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous.*

*Proof.* The proof follows from Corollary 2.7 of [6]. □

**Theorem 19.** *Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a function and  $g : (X, \tau) \rightarrow (X \times Y, \tau \times \sigma)$  the graph function of  $f$ , defined by  $g(x) = (x, f(x))$  for every  $x \in X$ . If  $g$  is faintly  $g$ -continuous, then  $f$  is faintly  $g$ -continuous.*

*Proof.* Let  $U$  be an  $\theta$ -open set in  $(Y, \sigma)$ , then  $X \times U$  is a  $\theta$ -open set in  $X \times Y$ . It follows that  $f^{-1}(U) = g^{-1}(X \times U) \in GO(X)$ . This shows that  $f$  is faintly  $g$ -continuous. □

**Definition 20.** A topological space  $(X, \tau)$  is said to be  $GO$ -connected [1] if  $X$  cannot be written as a disjoint union of two nonempty  $g$ -open sets.

**Theorem 21.** *If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a faintly  $g$ -continuous function and  $(X, \tau)$  is a  $GO$ -connected space, then  $Y$  is a connected space.*

*Proof.* Assume that  $(Y, \sigma)$  is not connected. Then there exist nonempty open sets  $V_1$  and  $V_2$  such that  $V_1 \cap V_2 = \emptyset$  and  $V_1 \cup V_2 = Y$ . Hence we have  $f^{-1}(V_1) \cap f^{-1}(V_2) = \emptyset$  and  $f^{-1}(V_1) \cup f^{-1}(V_2) = X$ . Since  $f$  is surjective,  $f^{-1}(V_1)$  and  $f^{-1}(V_2)$  are nonempty subsets of  $X$ . Since  $V_i$  is open and closed,  $V_i$  is  $\theta$ -open for each  $i = 1, 2$ . Since  $f$  is faintly  $g$ -continuous,  $f^{-1}(V_i) \in GO(X)$ . Therefore,  $(X, \tau)$  is not  $GO$ -connected. This is a contradiction and hence  $(Y, \sigma)$  is connected. □

**Definition 22.** A space  $(X, \tau)$  is said to be  $GO$ -compact [1] (resp.  $\theta$ -compact [11]) if each cover of  $X$  by  $g$ -open (resp.  $\theta$ -open) has a finite subcover.

**Theorem 23.** *The surjective faintly  $g$ -continuous image of a  $GO$ -compact space is  $\theta$ -compact.*

*Proof.* Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a faintly  $g$ -continuous function from a  $GO$ -compact space  $X$  onto a space  $Y$ . Let  $\{G_\alpha : \alpha \in I\}$  be any  $\theta$ -open cover of  $Y$ . Since  $f$  is faintly  $g$ -continuous,  $\{f^{-1}(G_\alpha) : \alpha \in I\}$  is a  $g$ -open cover of  $X$ . Since  $X$  is  $g$ -compact, there exists a finite subcover  $\{f^{-1}(G_i) : i = 1, 2, \dots, n\}$  of  $X$ . Then it follows that  $\{G_i : i = 1, 2, \dots, n\}$  is a finite subfamily which cover  $Y$ . Hence  $Y$  is  $\theta$ -compact. □

**Definition 24.** A topological space  $(X, \tau)$  is said to be:

- (i) countably  $g$ -compact [5] (resp. countably  $\theta$ -compact) if every countable cover of  $X$  by  $g$ -open (resp.  $\theta$ -open) sets has a finite subcover;
- (ii)  $g$ -Lindelof [5] (resp.  $\theta$ -Lindelof) if every cover of  $X$  by  $g$ -open (resp.  $\theta$ -open) sets has a countable subcover.

**Theorem 25.** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a faintly  $g$ -continuous surjective function. Then the following hold:

- (i) If  $X$  is  $g$ -Lindelof, then  $Y$  is  $\theta$ -Lindelof;
- (ii) If  $X$  is countably  $g$ -compact, then  $Y$  is countably  $\theta$ -compact.

*Proof.* The proof is similar to Theorem 23. □

**Definition 26.** A topological space  $(X, \tau)$  is said to be:

- (i)  $g$ - $T_1$  [4] (resp.  $\theta$ - $T_1$ ) if for each pair of distinct points  $x$  and  $y$  of  $X$ , there exists  $g$ -open (resp.  $\theta$ -open) sets  $U$  and  $V$  containing  $x$  and  $y$ , respectively such that  $y \notin U$  and  $x \notin V$ .
- (ii)  $g$ - $T_2$  [2] (resp.  $\theta$ - $T_2$  [11]) if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exists disjoint  $g$ -open (resp.  $\theta$ -open) sets  $U$  and  $V$  in  $X$  such that  $x \in U$  and  $y \in V$ .

**Theorem 27.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous injection and  $Y$  is  $\theta$ - $T_1$ , then  $X$  is a  $g$ - $T_1$ .

*Proof.* Suppose that  $Y$  is  $\theta$ - $T_1$ . For any distinct points  $x$  and  $y$  in  $X$ , there exist  $V, W \in \sigma_\theta$  such that  $f(x) \in V$ ,  $f(y) \notin V$ ,  $f(x) \notin W$  and  $f(y) \in W$ . Since  $f$  is faintly  $g$ -continuous,  $f^{-1}(V)$  and  $f^{-1}(W)$  are  $g$ -open subsets of  $(X, \tau)$  such that  $x \in f^{-1}(V)$ ,  $y \notin f^{-1}(V)$ ,  $x \notin f^{-1}(W)$  and  $y \in f^{-1}(W)$ . This shows that  $X$  is  $g$ - $T_1$ . □

**Theorem 28.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous injection and  $Y$  is a  $\theta$ - $T_2$  space, then  $X$  is a  $g$ - $T_2$  space.

*Proof.* Suppose that  $Y$  is  $\theta$ - $T_2$ . For any pair of distinct points  $x$  and  $y$  in  $X$ , there exist disjoint  $\theta$ -open sets  $U$  and  $V$  in  $Y$  such that  $f(x) \in U$  and  $f(y) \in V$ . Since  $f$  is faintly  $g$ -continuous,  $f^{-1}(U)$  and  $f^{-1}(V)$  are  $g$ -open in  $X$  containing  $x$  and  $y$ , respectively. Therefore,  $f^{-1}(U) \cap f^{-1}(V) = \emptyset$  because  $U \cap V = \emptyset$ . This shows that  $X$  is  $g$ - $T_2$ . □

Recall that for a function  $f : (X, \tau) \rightarrow (Y, \sigma)$ , the subset  $\{(x, f(x)) : x \in X\} \subset X \times Y$  is called the graph of  $f$  and is denoted by  $G(f)$ .

**Theorem 29.** *If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is faintly  $g$ -continuous injection and  $(Y, \sigma)$  is  $\theta$ - $T_2$ , then  $G(f)$  is  $g$ -closed in  $X \times Y$ .*

*Proof.* Let  $(x, y) \in (X \times Y) \setminus G(f)$ , then  $f(x) \neq y$ . Since  $Y$  is  $\theta$ - $T_2$ , there exist  $\theta$ -open sets  $V$  and  $W$  in  $Y$  such that  $f(x) \in V$ ,  $y \in W$  and  $V \cap W = \emptyset$ . Since  $f$  is faintly  $g$ -continuous,  $f^{-1}(V) \in GO(X, x)$ . Take  $U = f^{-1}(V)$ . We have  $f(U) \subset V$ . Therefore, we obtain  $f(U) \cap W = \emptyset$ . This shows that  $G(f)$  is  $g$ -closed.  $\square$

**Theorem 30.** *If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a surjective function with a  $g$ -closed graph, then  $(Y, \sigma)$  is Hausdorff.*

*Proof.* Let  $y_1$  and  $y_2$  be any distinct points of  $Y$ . Then since  $f$  is surjective, there exists  $x_1 \in X$  such that  $f(x_1) = y_1$ ; hence  $(x_1, y_2) \in (X \times Y) \setminus G(f)$ . Since  $G(f)$  is  $g$ -closed, there exist  $U \in GO(X, x_1)$  and an open set  $V$  of  $Y$  containing  $y_2$  such that  $f(U) \cap \text{Cl}(V) = \emptyset$ . Therefore, we have  $y_1 = f(x_1) \in f(U) \subset Y \setminus \text{Cl}(V)$ . Then there exists an open set  $H$  of  $Y$  such that  $y_1 \in H$  and  $H \cap V = \emptyset$ . Moreover, we have  $y_2 \in V$  and  $V$  is open in  $Y$ . This shows that  $Y$  is Hausdorff.  $\square$
